

OVERVIEW

eNhanse Persian Clover is possibly the most fragrant of all the clover species with a pleasantly sweet scent that may attract wildlife and livestock alike.

It's an annual legume that originated in the eastern Mediterranean area. It has a semi-upright growth habit, and the leaves are oval with jagged edges.

eNhanse Persian Clover has a notable root development speed that is similar to that of Daikon Radish, making it highly suitable for sandier soils.

Improved seedling vigor allows eNhanse to establish at a rate similar to Cereal Rye. The low C:N ratio makes it a good choice to mix with Cereal Rye as the contrasting ratios provide balance and help reduce the yield drag often experienced in corn following a cereal rye crop.

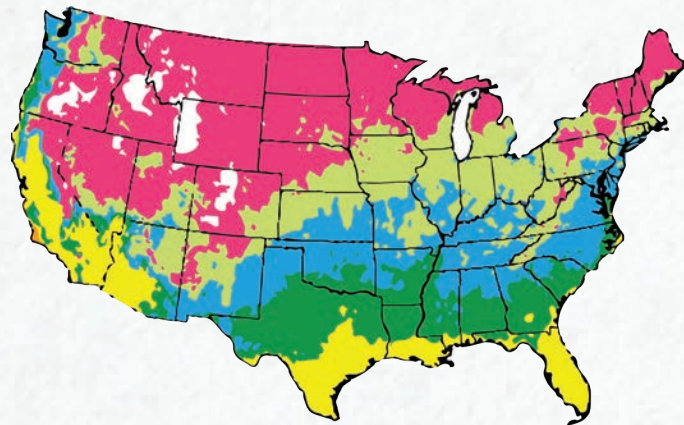

REGROWTH

eNhanse Persian Clover has high forage yield and excellent regrowth following grazing or cutting.

eNhanse can be cut 2 to 3 times, but not closer than 4 inches to allow for vigorous regrowth.

In irrigated fields the optimum cutting interval is approximately 6 weeks in the growing season, allowing dry matter yields of 5-6.5 tons an acre.

PLANTING

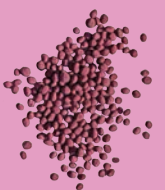

Fall Planting Dates

- Oct 1 - Dec 15
- Sept 15 - Nov 15
- Aug 15 - Sep 15
- Aug 15 - Sep 30
- Sept 1 - Sept 30

Spring Planting Dates

- Mar 15 - Apr 15
- Mar 30 - Apr 15
- April 15 - May 15
- May 1 - May 15

	Drilled	Broadcast
Seeding Rate	Mono-culture 5-8 lbs./acre In mixes 3-4 lbs./acre	Mono-culture 8-10 lbs./acre In mixes 5-8 lbs./acre
Planting Depth	1/4th inch	
Ideal Soil	Sandy to loam to clay-loam with a of pH 5.0	

eNhanse

PERSIAN CLOVER

The only Persian Clover with the ability to withstand temperatures as low as -15° F.

NITROGEN FIXATION

eNhanse Persian Clover is very effective at creating nitrogen. Nodules on the roots interact synergistically with the special rhizobia contained in the seed coating to "fix" nitrogen from the air.

eNhanse Persian Clover's low C:N ratio (12:1) means the organic material will quickly break down and release nitrogen to the following crop. eNhanse works with nature to provide farmers with a more natural and productive nitrogen source.

That's great news for both your bank account and cash crop.

ESTIMATED NITROGEN AVAILABILITY

2021 MISSISSIPPI STATE UNIVERSITY COVER CROP VARIETY TRIAL (PLANTED OCTOBER 7TH)

FIXED NITROGEN LBS. PER ACRE

Variety*	Termination Dates		
	15-Mar	1-Apr	15-Apr
eNhanse Persian	-	80	150
FIXatioN Balansa	-	98	126
Frosty Berseem	53	118	119
Survivor Winter Peas	41	67	117
Mean	43	59	70
CV%	38	42	41
LSD (.05)	51	62	90

*Annual species comparison

In trials at Mississippi State University in 2021, eNhanse Persian Clover produced 150 pounds of nitrogen per acre

GRAZING

eNhanse is a very palatable and nutritious clover that works well in close grazing situations, but care should be taken as it may cause bloat. Sowing eNhanse in a mixture with things like ryegrass or oats may reduce this risk.

In trials, eNhanse performed incredibly well, generating over 3,000 lbs. of dry matter per acre.

DRY MATTER YIELDS OF COVER CROP VARIETIES

2021 MISSISSIPPI STATE UNIVERSITY COVER CROP VARIETY TRIAL (PLANTED OCTOBER 7TH)

Variety*	Termination Dates		
	15-Mar	1-Apr	15-Apr
Frosty Berseem	1222	2950	3736
eNhanse Persian	563	1357	3112
FlXatioN Balansa	981	2170	2711
Survivor Winter Peas	1084	1457	2557
Mean	771	1363	2415
CV%	40	39	38
LSD (.05)	585	943	1587

*Annual species comparison

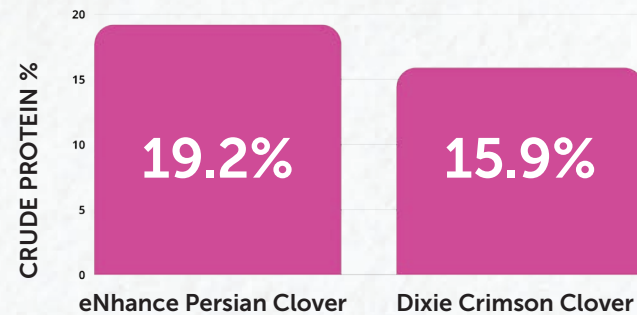

eNhanse Persian Clover has thick, hollow stems that make it a highly nutritious and digestible forage.

WILDLIFE PLOTS

eNhanse Persian Clover is known to be highly digestible with excellent forage yield and feed value with crude protein levels ranging from 18-24%.

With high protein levels, the ability to regrow when grazed, and abundant flowers, eNhanse is a great addition to food plots and wildlife habitat.

CRUDE PROTEIN FORAGE ANALYSIS (SPRING) ENHANCE PERSIAN VS. DIXIE CRIMSON

The coating used for eNhanse Persian clover is purple. If it's not purple it's not eNhanse*.

COST-EFFICIENCY

eNhanse's tiny seed size (207,000 seeds per lb) means a little bit goes a long way. The cost-per-acre is up to 50% less than many other legumes making it an economical alternative for planting alone or as part of grass mixtures.

As a nitrogen-fixing cover crop, it reduces the need for expensive fertilizers.

eNhanse Persian Clover is notable for root development speed similar to that of Daikon Radish, making it suitable for sandier soils.

*eNhanse Persian clover seed coated for the organic market will be gray in color due to OMRI restrictions on coating colorants.

VERSATILITY

eNhanse Persian Clover can be used as a cover crop for nitrogen production and weed control or as a forage in mixtures with other legumes and grasses.

MOISTURE REQUIREMENTS

eNhanse Persian Clover is best adapted to areas receiving 17+ inches of precipitation. eNhanse is also tolerant of moderate periods of waterlogged soils.

FERTILIZER & ESTABLISHMENT

eNhanse is adapted to a wide range of soils from clay loams to heavy clay soils and tolerates poor drainage. The best growth is on alkaline soils, but it will grow well with a pH range of 5.0 to 8.0.

LATER MATURITY

eNhanse Persian Clover matures approximately 21 days later than Dixie Crimson Clover, while still producing greater overall growth throughout the growing cycle.

This later maturity allows for multiple cuttings or grazing.

COLD TOLERANCE

While most Persian clovers are not very cold tolerant, eNhanse Persian Clover was bred to endure low temperatures and harsh conditions.

In trials at our Southern Iowa Research Farm, eNhanse performed exceptionally well, enduring temperatures as low as -15° F.
